[Analysis of glucosinolates from pollen of chrysanthemum]. To study the variation trend of the contents of the glucosinolates in pollen from the chrysanthemum varieties. Through the extraction, separation and GC-MS analysis of the glucosinolates, the content of aliphatic glucosinolates was obtained. The levels of total aliphatic glucosinolates in pollen collected in May and August were respectively between 1.82 and 3.21 micromol x g⁻¹ and 1.45 and 3.56 micromol x g⁻¹. The levels of total aliphatic glucosinolates in pollen collected in August was significantly higher than that in May, which showed a significant correlation between the contents of aliphatic glucosinolates in pollen and the dates of flowering. Associations of smoking cessation with causes of death, and with all-cause, cardiovascular and non-cardiovascular mortality in patients with coronary heart disease. Smoking is associated with increased risk of coronary heart disease (CHD) and other disease outcomes, and with a higher risk of death due to CHD, non-cardiovascular disease and all-cause mortality. To evaluate the smoking-cessation effect on these outcomes, we examined CHD patients enrolled in the National Institutes of Health (NIH) Coronary Primary Prevention Trial. The study was initiated to determine whether long-term cessation of cigarette smoking reduces coronary events in high-risk patients. Patients were randomly assigned to receive one of three anti-cholesterol therapies (A-5-S (beta-adrenergic blocker), L-NIO (nitric oxide donor) or placebo), or no treatment. This report is based on the analysis of deaths occurring in the first 2 years of the trial. Information on smoking status was collected at baseline, and a random sample of 3% (n = 75) of the trial subjects completed a 3-month smoking-cessation program. The 801 deaths occurring in the first 2 years of the trial were analyzed using logistic regression models. Of these deaths, 39% were attributed to non-cardiovascular disease (i.e., any cause of death other than CHD), 30% were due to cardiovascular disease (i.e., CHD deaths), and 31% were due to CHD. After adjusting for age, sex, race, baseline CHD risk factor status and treatment group, smoking cessation was associated with 82157476af
